

# Grid feeding monitoring according to VDE-AR-N 4105, VDE-AR-N 4110 and VDE-AR-N 4120

## CM-UFD.M31

## CM-UFD.M31M with Modbus RTU

The CM-UFD.M31(M) with Modbus RTU is a multifunctional grid feeding monitoring relay. It provides different monitoring functions in accordance with VDE-AR-N 4105, VDE-AR-N 4110 and VDE-AR-N 4120 to detect over- and undervoltage (10-minutes average value, voltage increase and decrease protection) as well as any changes in grid frequency (frequency increase and decrease protection).

The device is connected between the distributed generation and the public grid in order to disconnect the distributed generation in case of problems (e.g. unstable grid), faults or maintenance on the grid. Additionally, monitoring of ROCOF (rate of change of frequency) and vector shift can be configured.

## Characteristics

- Monitoring of voltage and frequency in single- and three-phase mains (2-wire, 3-wire or 4-wire AC systems)
- Type-tested in accordance with VDE-AR-N 4105, VDE-AR-N 4110 and VDE-AR-N 4120
- Pre-settings in accordance with VDE-AR-N 4105 and VDE-AR-N 4110
- Possibility to adjust settings in accordance to the VDE-AR-N-4120 recommended values
- Note on VDE-AR-N 4110:2018-11:  
Can be used as subordinate end coupling protection and as higher-level end coupling protection if no Q-U protection is required
- Integrated management of redundancy function (acc. to VDE-AR-N 4105, mandatory in plants with P>30 kW)
- Modbus RTU communication interface\*
- Multiline, backlit LCD display
- True RMS measuring principle
- Over- and undervoltage, 10-minutes average value as well as over- and underfrequency monitoring
- Two-level threshold settings for over-/undervoltage and over-/underfrequency
- ROCOF (rate of change of frequency) monitoring and vector shift configurable
- Interrupted neutral detection
- All threshold values and tripping delays adjustable
- Error memory for up to 99 entries (incl. cause of error, measured value, relative timestamp)
- Test function
- Password setting protection
- 3 control inputs, e.g. for feedback signal, remote trip
- 3 c/o (SPDT) contacts
- Can be connected to ABB Ability™ Electrical Distribution Control System (see EDCS Getting Started, document no. 1SDC200063B0204)\*
- Various certifications and approvals (see overview, document no. 2CDC112249D0201)
- Suitable for installation on the low-voltage side of MV/HV networks

## Ordering details

| Type        | Rated control supply voltage | Measuring range                   | Order code      |
|-------------|------------------------------|-----------------------------------|-----------------|
| CM-UFD.M31M | 24-240 V AC/DC               | L-L: 0-540 V AC / L-N: 0-312 V AC | 1SVR560731R3701 |
| CM-UFD.M31  | 24-240 V AC/DC               | L-L: 0-540 V AC / L-N: 0-312 V AC | 1SVR560730R3401 |

\* For CM-UFD.M31M only

# Functions

## Operating controls

### Display

|      |          |    |    |    |    |
|------|----------|----|----|----|----|
| L1N: | 230.0V   |    |    |    |    |
| L2N: | 230.2V   |    |    |    |    |
| L3N: | 229.7V   |    |    |    |    |
|      | 49.99 Hz |    |    |    |    |
| R1   | R2       | R3 | Y1 | Y2 | Y3 |

R1R2R3: relay status; in this case R3 is de-energized

Y1: status feedback loop Y1-Y0

Y2: status feedback loop Y2-Y0

Y3: status control input Y3-Y0,  
in this case Y3-Y0 is open

### Indication of operational states

U/T: green LED - Control supply voltage applied  
 Timing

F: red LED - Fault message

Rx/Tx: yellow LED - Modbus frame reception and transmission

### Keypad

ESC: escape / return to previous menu

Λ: up / value increase

V: down / value decrease

OK: enter / confirm selection

## Application

The CM-UFD.M31(M) is a multi-functional grid feeding monitoring relay which is installed between the renewable energy system such as photovoltaic systems, wind turbines, block-type thermal power stations and the public grid. The innovative relay guarantee grid stability and prevent blackouts. If the public grid's voltage or frequency moves out of the permitted ranges, the device uses a decoupling unit (e.g. contactor or circuit breaker) to separate the renewable energy system from the public grid. As soon as the grid is stable again, the system is automatically reconnected.

The fault is indicated by LED and the corresponding plain text message is shown on the display. In conformity with VDE-AR-N 4105, the CM-UFD.M31(M) relay can be used in all renewable power plants > 30 kW. Furthermore, it is suitable for installation on the low-voltage side of MV/HV networks.

## Operating mode

The CM-UFD.M31(M) can be set up to monitor single- and three-phase mains (2-wire, 3-wire as well as 4-wire AC systems). The unit is configurable by front-face push-buttons. A display with the corresponding menu enables the selection of presettings as well as the precise adjustment of the different threshold values and corresponding time delays. Furthermore, the display visualizes the measured values clearly. Together with the front-face LEDs, it shows all information about operational states of output relays and control inputs. With the Modbus RTU interface, all process values and status information from the CM-UFD.M31(M) can be read out and control commands can be executed.\*

The CM-UFD.M31(M) provides 3 output relays and 3 control inputs. Output relays R1 (11<sub>15</sub>-12<sub>16</sub>/14<sub>18</sub>) and R2 (21<sub>25</sub>-22<sub>26</sub>/24<sub>28</sub>) are required for disconnection of a distributed generation from the public grid. The corresponding feedback signals from the external contacts are monitored via the control inputs Y1-Y0 and Y2-Y0. The third output relay R3 (31<sub>35</sub>-32<sub>36</sub>/34<sub>38</sub>) can be used for signalization of an event in the grid or a bus fault or the closing command of a motor drive for circuit breaker or switch disconnector. Typically, it is often used to send a signal to the inverter in the event of a fault. Additionally, it can be configured to act synchronously with R1/R2 or controlled via bus.

The control inputs Y1-Y0 and Y2-Y0 monitor the corresponding feedback signals from the first and the second switching device. The third control input Y3-Y0 allows to trip the grid feeding monitoring relay (remote trip), to suppress Y1, to suppress Y2, to suppress Y1/Y2 or to suppress the vector shift detection.

\* For CM-UFD.M31M only

## Protective functions

If control supply voltage is applied, all phases are present and the switch-on conditions for voltages and frequency are fulfilled, output relays R1 and R2 energize synchronously after the adjusted switch-on delay. The green LED U/T flashes while timing and turns steady when the switch-on delay is complete.

If a measured value exceeds or falls below the set threshold value (overvoltage, undervoltage, overfrequency or underfrequency), R1 and R2 de-energize after the adjusted tripping delay. As soon as the measured value returns to the tolerance range - taking into account an adjustable hysteresis – and all further switch-on conditions are fulfilled, R1 and R2 re-energize. The fault is indicated by the red LED F and the type of fault is shown on the display as a plain text message. The event that has caused tripping of the relay is recorded in the event list. The green LED U/T flashes while timing and turns steady when the delay is complete.

## Output relay R3 (31<sub>35</sub>-32<sub>36</sub>/34<sub>38</sub>)

The output relay R3 can be used for:

- Trip signalization  
R3 reacts synchronously with R1/R2. ON-time of R3 is inactive.
- Closing command of a breaker motor  
In case output relays R1 and R2 energizes, the adjusted ON-delay starts. When timing is complete, output relay R3 will be activated for the duration of the ON-time or until relay R1 and R2 de-energizes.
- Bus fault signalization  
In case of no bus communication during the adjusted bus timeout, the bus fault is signaled by R3 (e.g. no sign of life from the bus master)
- Additionally the control of R3 via bus or a deactivation is possible. With these configurations the settings for the ON-delay and the ON-time have no influence on the operating function.
- To send a signal to the inverter in the event of a fault

### Operating principle

<sup>1)</sup> Depending on individual configuration

## Monitoring functions

The device utilises several separately adjustable monitoring functions for:

- Over voltage protection:  $> U_{AV}$ ,  $> U_1$ ,  $> U_2$
- Under voltage protection:  $< U_1$ ,  $< U_2$
- Over frequency protection:  $> F_1$ ,  $> F_2$
- Under frequency protection:  $< F_1$ ,  $< F_2$

Protective function UAV (10-minutes average value):

The CM-UFD.M31(M) calculates the sliding average value of the 3 phases over a period of 10 minutes. The voltage values are updated every 3 seconds. If the 10-minutes average value exceeds the threshold value, the output relays trip.

### ANSI codes for monitoring functions

| Monitoring function                   | ANSI code |
|---------------------------------------|-----------|
| Overvoltage ( $>U_1, >U_2, >U_{av}$ ) | 59        |
| Undervoltage ( $<U_1, <U_2$ )         | 27        |
| Overfrequency ( $>F_1, >F_2$ )        | 81O       |
| Underfrequency ( $<F_1, <F_2$ )       | 81U       |
| Vectorshift                           | 78        |
| ROCOF                                 | 81R       |

## Timing diagrams for relay operation

### Over-/under voltage event detection

### Over-/under frequency event detection

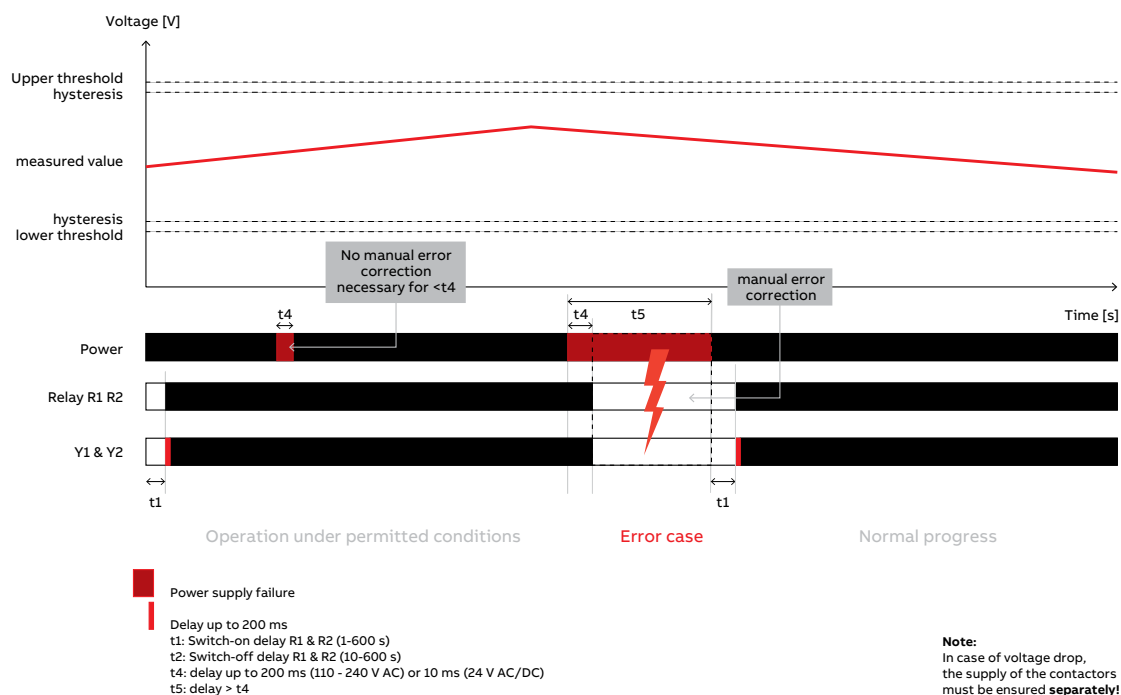

Delay up to 200 ms  
 t1: Switch-on delay R1 & R2 (1-600 s)  
 t2: Switch-off delay R1 & R2 (10-600 s)  
 t3: Switch-on delay R3 (0-10 s)

### Failure in feedback signals (Y1-Y0, Y2-Y0)

### Failure in power supply of relay

## Control inputs Y1-Y0, Y2-Y0

Both control inputs Y1-Y0 and Y2-Y0 are used as feedback contacts for the 2 switching devices of the section switch. The current status of the switching devices is monitored by the grid feeding monitoring relay. The function of these control inputs can be configured as “disabled”, “enabled” or “tripping only”. The working principle of the control inputs can be configured as “normally closed”, “normally open” or “auto detection”. Please note that “normally” here refers to “good status” of the grid, when all the monitored voltages and the frequency stay within the set threshold values and output relays R1 and R2 are energized. A failure in the feedback loop has to be removed manually on the device.

## Control input Y3-Y0

The function of control input Y3-Y0 can be configured as “remote trip”, “suppress Y1”, “suppress Y2”, “suppress Y1/Y2”, “suppress vector shift detection” or completely “disabled”. Working principle of the control input can be configured as “normally open” or “normally closed”.

**Remote trip:** With Y3-Y0 configured as “normally closed”, output relays R1 and R2 de-energize if Y3-Y0 is opened, and vice versa.

**Suppress Y1, suppress Y2, suppress Y1/Y2:** These functions can be used to suppress evaluation of the chosen feedback loop during synchronization of a generator, so that the status of the feedback signal will not be considered as a feedback error. An alternative solution is to set the release window of the corresponding feedback loop larger than the possible duration of synchronization process.

### Y3-Y0 wiring schematic

## Remote trip

The Modbus RTU and the control input Y3-Y0 allow remote tripping of the grid feeding monitoring relay. The remote trip input can be configured as normally open or normally closed. If normally closed is configured, the relay trips if Y3-Y0 is opened. If normally open is configured, the relay trips if Y3-Y0 is closed. The output relay R1 is tripped by the remote trip within less than 20 ms. When the remote trip input is deactivated, the output relay R1 energizes again.

## ROCOF (Rate of change of frequency $df/dt$ )

This function monitors the rate of change of frequency within a very short time and detects an imminent loss of mains (islanding). The ROCOF function detects zero crossings of the grid voltages. It measures the time between the zero crossings and calculates a new frequency after each zero crossing. In case the frequency changes too much since the last zero crossing, the output relay R1 trips. After the adjusted error time the relay de-energizes automatically.

The ROCOF monitoring function is deactivated per default and must be activated in the menu.

## Vector shift detection

This function is another possibility of detecting a loss of mains (islanding).

The vector shift detection is disabled by default and can be manually enabled in the menu. Through zero crossings the device detects the vector shift of mains voltage and de-energizes output relays R1 immediately if the shift exceeds the adjusted threshold value, e.g. 10°. Only after the set error time the switch-on conditions will be evaluated in order to start an auto reconnection.

## Switch-on conditions

In order to switch on the section switch after having applied control supply voltage or after a fault, the voltages as well as the frequency must stay within the set switch-on conditions during the switch-on delay. This window of voltage and frequency can be further restricted in the menu "Switch-on conditions". If one parameter leaves the window, the switch-on process is interrupted. When all parameters fulfill the switch-on conditions again, the switch-on delay restarts. When the switch-on time is complete, relays R1 and R2 re-energize automatically. If the function "Short interruption" is enabled in the menu "Switch-on conditions" -> "Switch-on delay", the switch-on delay will be reduced to 5 s in case of a short interruption of < 3 s.

## Interrupted neutral detection

Interrupted neutral detection is always active when a phase-neutral measuring principle is selected in the menu "Nominal voltage". The interruption of the neutral conductor will result in an immediate tripping of output relays R1 and R2.

## Automatic reconnecting attempts

If an error occurs at feedback loop Y1-Y0 or Y2-Y0 (e.g. undervoltage release because of a lightning strike), 0, 1, 2 or 3 automatic reconnecting attempts will be carried out, taking into account the switch-on conditions. Therefore a temporary feed-back error doesn't have to be handled manually. The corresponding error in the feedback loop is stored in the error list. By default the number of automatic reconnection attempts is set to 0 and can be manually adjusted to maximum of 3.

## Error memory

The CM-UFD.M31(M) records and logs the last 99 events that caused tripping of the grid feeding monitoring relay as well as any interruption of the control supply voltage. The type of error as well as the current value of the operation counter is recorded into the internal error list, accessible via the menu. The list is stored internally in a non-volatile memory which can be reset by the user.

## Test function

The test function can be used to simulate an error in the installation. This way, the time delays of the feedback loops can be determined. A feedback loop includes the output relay, the corresponding switching device and the feedback contact.

The test function can be started by pressing the ESC button for 3 seconds. The output relays R1 and R2 de-energize immediately and the CM-UFD.M31(M) gets feedback signals from the section switch through control inputs Y1-Y0 and Y2-Y0 respectively. The time intervals from de-energizing both output relays to receiving both feedback signals is shown on the display. Return to the menu is realized by confirming with the OK button.

## Password protection

In order to meet the requirements of VDE-AR-N 4105, each CM-UFD.M31(M) offers the possibility of a two-stage password protection. The relay is supplied with the standard passwords [0000] to protect its settings. The installer/plant operator is responsible for checking the parameter values and changing the password with a personal one to avoid unwanted changes.

The installer/plant operator has the possibility to set all standard-related as well as non-standard related parameters, such as Modbus function etc., and protect them from unauthorized access by setting the password „A“ (plant operator).

While the renewable power plant is connected to the public grid, the grid operator can adjust the grid-related parameters and protect them with a separate password „B“ (grid operator).

The visualization of the parameters is possible at any time, changes are possible only after entering the password. While entering the password, the password protection is temporarily disabled until the menu is exited. Only the parameters 'Autotest', 'Language', 'Display switch-off delay' and 'Contrast' are not password-protected.

# Modbus RTU\*

This communication interface enables control commands (remote trip) to the CM-UFD.M31M and provides status information as well as actual process values.

## RS-485 Standard

RS-485 is a serial interface standard for communication over a twisted-pair cable. The RS-485 standard specifies only the electrical characteristics of the bus system. The RS-485 transmission line consists of three wires: A, B and C. The signal transmission is based on the voltage difference between the wires. The isolated signal ground should be connected to prevent common mode voltage between the network devices from drifting outside the allowable limits. RS-485 bus cable should be terminated with a resistor on both ends to prevent signal reflection.

## Network characteristics

Bus termination is required to prevent signal reflections from the bus cable ends. The CM-UFD.M31M is not equipped with internal bus termination, therefore external termination resistors have to be used according to Modbus specifications. The Modbus slave address, baud rate and communication timeout can be set in the CM-UFD.M31M. It is possible to configure a maximal time without telegrams from the master before the CM-UFD.M31M triggers the configured bus fault reaction. Per default, a timeout of 10 s is set. When changing communication parameters, no power cycle is necessary.

Cable type and cable length have to be selected according to the Modbus specification. The use of passive bus sublines should be avoided. For integrating the CM-UFD.M31M into an ethernet network, such as Modbus TCP/IP, an ethernet gateway can be used.

## Configuration of the Modbus RTU communication menu

- The bus address can be adjusted with the CM-UFD.M31M menu. The CM-UFD.M31M allows an address to be set between 001 and 247.
- For Modbus RTU it is necessary to configure at least the baud rate and the parity.

## Bus fault reaction

- The bus fault reaction can be set the following ways:
- Trip R1 and R2 - Disconnection of the distributed generation from the grid
- Signalization of a bus fault via R3
- Signalization of a bus fault via fault message in the display

\* For CM-UFD.M31M only

## ABB Ability™ Electrical Distribution Control System

Over Modbus RTU the CM-UFD.M31M can be connected to the ABB Ability™ Electrical Distribution Control System.

ABB Ability™ Electrical Distribution Control System is built on a state-of-the-art cloud architecture for data collection, processing and storage.

Following information are available in the cloud:

- All measured values (e.g. frequency and voltage)
- I/O Data (e.g. state of relays)
- Diagnostic data (e.g. Last trip reason)

For the initial setup please see "Ekip Com Hub Getting Started" (1SDC200063B0204)

For a detailed integration of the CM-UFD.M31M into ABB Ability™, please see the application note (2CDC112278D0201).

## Configuration

The CM-UFD.M31(M) is delivered with default settings in accordance to the VDE-AR-N 4105 and VDE-AR-N 4110. The default values in accordance to VDE-AR-N 4120 may be manually set. The menu structure starts with the main page that shows the real time measured values. Use the arrow keys to switch between the real time voltages and the 10-minutes average voltages.

### Display menu structure, navigation and possible configurations

#### Main page

#### Menu navigation

- If the display is dark, press any button to light it up
- Press OK button to enter the menu
- Press arrow buttons to move between functions and parameters
- Press OK button to enter the chosen page
- Press arrow buttons to modify the values of the parameters
- Press OK button to confirm the value and proceed
- Press ESC button to return to the previous menu
- Press arrow buttons more than 1 s to scroll through the menu or password menu

Changes of parameters can be cancelled by pressing the ESC button.

# Display and failure messages

```

L1N: 184.4V <U0N
L2N: 184.7V <U0N
L3N: 184.1V <U1
49.99 Hz
R1 R2 R3 Y1 Y2 V3

```

The voltage at L3 has fallen below the first undervoltage threshold. The voltages at L1 and L2 have fallen below the switch-on conditions, yet not below the undervoltage threshold.

```

L1N: 230.0V
L2N: 230.3V
L3N: 229.7V
50.61 Hz ROCOF
R1 R2 R3 Y1 Y2 V3

```

Error, ROCOF

Threshold for rate of change of frequency exceeded.

```

L1N: 260.2V >U0V
L2N: 260.3V >U0V
L3N: 260.0V >U0V
49.99 Hz
R1 R2 R3 Y1 Y2 V3

```

Error overvoltage  $U_{AV}$  in all three phases detected. If overvoltage occurs in one phase only,  $>U_{AV}$  indicates the phase with overvoltage.

```

L1N: 230.0V
L2N: 230.3V
L3N: 229.8V
49.61 Hz VS
R1 R2 R3 Y1 Y2 V3

```

Error, vector shift

Threshold for vector shift exceeded.

```

L1N: 260.2V >U1
L2N: 260.3V >U1
L3N: 260.0V >U1
49.99 Hz
R1 R2 R3 Y1 Y2 V3

```

Error overvoltage  $>U1$  in all three phases detected. If overvoltage occurs in one phase only,  $>U1$  indicates the phase with overvoltage.

```

Neutral conductor
is not connected!
R1 R2 R3 Y1 Y2 V3

```

4-wire connection

The neutral conductor is disconnected or interrupted. Please check wiring.

```

L1N: 264.6V >U2
L2N: 264.9V >U2
L3N: 264.6V >U2
49.99 Hz
R1 R2 R3 Y1 Y2 V3

```

Error overvoltage  $>U2$  in all three phases detected. If overvoltage occurs in one phase only,  $>U2$  indicates the phase with overvoltage.

```

L1N: 230.0V
L2N: 230.3V
L3N: 229.7V
49.61 Hz
Feedback Y1
R1 R2 R3 Y1 Y2 V3

```

Error in feedback loop Y1-Y0, e.g. wiring failure or welded feedback contact. Please check wiring.

```

L1N: 190.3V <U1
L2N: 190.5V <U1
L3N: 190.1V <U1
49.99 Hz
R1 R2 R3 Y1 Y2 V3

```

Error undervoltage  $<U1$  in all three phases detected. If undervoltage occurs in one phase only,  $<U1$  indicates the phase with undervoltage.

```

L1N: 230.1V
L2N: 230.3V
L3N: 229.7V
49.61 Hz
Press ESC!
R1 R2 R3 Y1 Y2 V3

```

Error in feedback loop is removed. Press ESC to reset the grid feeding monitoring relay.

```

L1N: 90.2V <U2
L2N: 90.3V <U2
L3N: 90.2V <U2
49.99 Hz
R1 R2 R3 Y1 Y2 V3

```

Error undervoltage  $<U2$  in all three phases detected. If undervoltage occurs in one phase only,  $<U2$  indicates the phase with undervoltage.

```

L1N: 229.9V
L2N: 229.2V
L3N: 229.1V
49.99 Hz
Internal error
R1 R2 R3 Y1 Y2 V3

```

Failure within the logic or hardware of the device. Remove supply and restart. If failure still occurs, there is a permanent failure in the device.

```

L1N: 230.0V
L2N: 230.2V
L3N: 229.6V
51.99 Hz >F1
R1 R2 R3 Y1 Y2 V3

```

Error overfrequency  $>F1$  detected

```

L1N: 230.2V
L2N: 230.2V
L3N: 230.3V
49.99 Hz
Remote trip via Y3
R1 R2 R3 Y1 Y2 V3

```

Remote trip via Y3

Shows that the remote trip is activated via control input Y3

```

L1N: 230.3V
L2N: 230.5V
L3N: 230.1V
51.99 Hz >F2
R1 R2 R3 Y1 Y2 V3

```

Error overfrequency  $>F2$  detected

```

L1N: 229.9V
L2N: 230.3V
L3N: 229.7V
49.99 Hz
Remote trip via bus
R1 R2 R3 Y1 Y2 V3

```

Remote trip via Bus\*

Shows that the remote trip is achieved via Bus and output relay R1 is de-energized.

```

L1N: 230.5V
L2N: 230.7V
L3N: 230.3V
49.00 Hz <F1
R1 R2 R3 Y1 Y2 V3

```

Error underfrequency  $<F1$  detected

\* For CM-UFD.M31M only

# Connection and wiring

## Example of single-phase application

## Example of three-phase application

### Legend

1. Control supply voltage for CM-UFD.M31(M)
2. Public grid
3. Protection fuse for the CM-UFD.M31(M)
4. Protection fuse for the measuring circuit of the CM-UFD.M31(M) (optional)
5. Short-circuit protection
6. Undervoltage release
7. Control input for feedback function
8. Switching device of the section switch
9. Switching device of the generator and/or inverter
10. Generator and/or inverter
11. Primary switch mode power supply unit CP-E (230 V AC / 24 V DC) for the buffer module CP-B
12. Ultra-capacitor based buffer module CP-B (24 V DC in/out)
13. Wire protection fuse for the output of the buffer module CP-B

# Technical data

Data at  $T_a = 25^\circ\text{C}$  and rated values, unless otherwise indicated

## Input circuits\*

| Supply circuit                               |          | A1-A2                                                  |
|----------------------------------------------|----------|--------------------------------------------------------|
| Rated control supply voltage $U_s$           |          | 24-240 V AC/DC                                         |
| Rated control supply voltage $U_s$ tolerance |          | -15...+10 %                                            |

| Minimum control pulse length                     |                                    | 20 ms                                                                              |
| Maximum cable length at the control inputs       |                                    | 10 m                                                                               |

\*Voltage transformers may be used in low voltage applications to transform and adapt the measuring input to ensure the voltage magnitude applied to the input terminals fall within the beforementioned voltage range. This to allow for the effective application of the Under-/Overvoltage and Under-/Overfrequency monitoring functions.

# Cyber security

## Legal disclaimer

The CM-UFD.MxxM is designed to be connected in the ABB and 3rd party products and communicate information data via network interface. It is the user's sole responsibility to provide and continuously ensure a secure connection between the product and the user's network or any other. The user shall establish and maintain any appropriate measures (such as but not limited to the installation of fire-walls, application of authentication measures, encryption of data, installation of anti-virus programs, etc.) to protect the product, the network, its system, and the interface against any kind of security breaches, unauthorized access, interference, intrusion, leakage and/or theft of data or information. ABB and its affiliates are not liable for damages and/or losses related to such security breaches, any unauthorized access, interference, intrusion, leakage and/or theft of data or information. The data, examples and diagrams in this manual are included solely for the concept or product description and are not to be deemed as a statement of guaranteed properties. All people responsible for applying the equipment addressed in this manual must satisfy themselves that each intended application is suitable and acceptable, including that any applicable safety or other operational requirements are complied with. Any risks in applications where a system failure and/or product failure would create a risk for harm to property or persons (including but not limited to personal injuries or death) shall be the sole responsibility of the person or entity applying the equipment, and those so responsible are hereby requested to ensure that all measures are taken to exclude or mitigate such risks. This document has been carefully checked by ABB, but deviations cannot be completely ruled out. In case any errors are detected, the reader is kindly requested to notify the manufacturer. Other than under explicit contractual commitments, in no event shall ABB be responsible or liable for any loss or damage resulting from the use of this manual or the application of the equipment.

## Enhancing network security

The implementation of the following measures is highly recommended in order to enhance the security of networks:

1. Network Isolation – separate the OT network (operation technology) from the IT network (information technology). This helps prevent any attack reaching the IT network from spreading to the OT network.
2. Use of firewalls – Implement firewalls to prevent unauthorized access to the OT network.
3. Use of access control – Implement access controls to restrict the human and device access to the OT network.
4. Keep software up to date – Make sure all software/firmware of the devices are up to date to have the latest security updates installed.
5. Reduce attack surface on devices – Disable device functions, services and ports not needed.
6. Replace default passwords – Replace all default passwords of the devices to prevent attacker from getting access using default credentials.
7. Monitor network activity – Monitor the OT network for any malicious activities that could be a sign of an attack. Example of network monitoring tool is intrusion detection system (IDS).
8. Train employees – Train operators and service people on IT and OT security best practices.
9. Train employees – Train operators and service people on IT and OT security best practices.
